Both social media and homosexuality have been thoroughly examined by scholars. The relationship between the two, however, is not well researched and thus deserves more scholarly attention. The purpose of this study is to fill this void by investigating the role of social media in homosexuality. In other words, the study wants to know if the use of social media encourages gays and lesbians to come out, and if it strengthens gay or lesbian communities. This study specifically seeks to understand if homosexuals who often use social media are more likely to come out than homosexuals who never or rarely use social media since social media provides an outlet and a community of support for gays and lesbians. This study will combine online survey with focus group interviews. The study will use snowballing sampling to distribute a confidential survey to 500 participants who identify themselves as homosexuals. Twenty homosexual students from a mid-sized Midwestern university will be invited to fill out the same survey and participate in a focus group conversation on social media and homosexuality. The survey data will be cleaned up and imported into the statistical software SPSS for data analysis. The study finally examines if the above hypothesis will be supported or not.
